Abstract

This study examined the effect of dispute resolution strategies on employee performance in the Nigerian banking industry. Two variables were discussed; compromising strategy and integrating strategies as they affect employee performance in selected banks in Delta State. The sample size for the study was 162 respondents. A simple random sampling technique was adopted. Validated structured sets of questionnaires were used, the primary instruments for data collection. The study adopted descriptive statistics and frequency analysis. A test of hypotheses was done using regression analysis. The study found that there were positive and significant effects of compromising Strategy and integrating strategy on employee performance. The study concluded that integrating strategy has a major effect on employee performance in Nigeria's banking industry and Nigeria banks should improve on integrating strategy because it would go a long way in enhancing employee performance and that integrity in the banks could have been achieved through strong moral principles and moral uprightness in financial transactions. It is recommended that Efforts should be made by management to organize seminars/workshops on organizational dispute resolution strategy from time to time for the employees. This will enable employees to learn about disputes and how they can be effectively managed for organizational effectiveness. Credible channels of communication and open discussions of disputes in work relations must be encouraged in an attempt to avoid confrontation, unhealthy competition, and domination as dispute resolution strategies. The study contributed to knowledge by developing a model that explains the relationship between dispute resolution and employee performance in the banking sector and also provided a framework that explains the necessity of dispute resolution and how it relates to employee performance in an organized setting.

1.Introduction

There has never been a corporation that has never had a conflict. Antagonisms, tensions, aggressions, stereotypes, unfavorable attitudes, and disappointments will always be present in every organization in which men must live and work together. People's lives are inextricably linked to conflict. In the organization, there are many different perspectives on conflict. Some people regard conflict as a negative experience that must be avoided at all costs. Others feel that conflict is a natural occurrence that must be dealt with (Eyjolfsdottir & Smith, 2019). From this perspective, a conflict is viewed as an opportunity for personal growth, and individuals try to take advantage of it. In companies, potential conflict may arise in almost every choice that management must make. One of the most crucial components of the manager's job is dealing with possible conflicts swiftly and effectively. Because conflict appears to be inevitable, managers must be able to detect the origins of the conflict, assess its constructive as well as destructive potential, learn how to manage conflict, and put dispute resolution procedures into practice (Fleetwood, 2017).

Dispute is an unavoidable element of working life; we all have our perspectives, ideas, and sets of beliefs. We all have our perspectives on things and act in ways that we believe are appropriate. Some people may see conflict as a bad, undesirable condition that has to be avoided. On the other hand, some people may see it as a fact, that must involve management. Others think about it as an opportunity for personal growth. Since disputes arise at all levels of the organization, in recent decades, their study has become a subject of interest to many practitioners and theorists. Because dispute is seemingly inevitable, evidently managers must be able to recognize the source of the dispute, view its constructive as well as destructive potential, learn how to manage disputes, and apply dispute resolution techniques in a practical way (Dumaine, 2014).

Until the '90s of the 19th century, the literature viewed dispute as a counterproductive phenomenon. Theorists have proposed that organizational disputes can be constructive, under certain circumstances. However, empirical studies have not confirmed the view of theorists. Over time, organizations have become less centralized and the workers were connected and dependent on the work of each other. Since then, workplace conflict has grown increasingly prominent in organizations. Workers become increasingly reliant as the business becomes more decentralized, and decision-making responsibility grows (Nohria, & Garcia, 2018). As a result of these developments, new sorts of labor disputes have emerged amongst diverse groups of

employees. In addition, the workforce is growing increasingly diversified. More women, immigrants, and ethnic minorities, as well as persons from various educational and cultural backgrounds, worked in organizations. In comparison to the past when the organization's staff was mostly homogeneous, this variety has unavoidably resulted in the rise of various sorts of workplace disputes (Williams & O'Reilly, 2018).

On the other hand, an employee is a major human resource hired by organizations to perform tasks, under certain conditions, to meet various organizational goals. An employee is a person employed for wages or a salary and includes an apprentice (Kenya Employment Act, 2007). Employees are the most important asset in an organization and without them, the running of an organization becomes difficult because they support the smooth running and success of the organization through various tasks and activities to meet the organization's goals (Hwang, 2010). Employee performance is the contribution of employees to meet organizational goals and how well an individual executes their duties and responsibilities within the organization (Thao & Hwang, 2010). Performance is a critical factor for the success of an organization and therefore management through its HR department should ensure that the policies and procedures used in the evaluation process impact positively employees and drives them to perform effectively (Dobre, 2013). The identified practices that encourage effective employee performance include motivation, reward, and good industrial relations. Saeed, Anis-ul-Haq, Almas, and Niazi (2014) stated that management has to look after the welfare of employees by encouraging them to perform effectively and without neglecting other resources at the disposal of the organization.

In organizations, employee performance is usually measured through employee evaluations which are done annually, quarterly, and semi-annually depending on the organization. Employee evaluation refers to the process of assessing the general performance of an individual employee and is normally carried out by immediate supervisors (Dobre, 2013).

The study focused on the effect of dispute resolution strategies on employee performance in the Nigerian banking industry. The Nigerian workforce has a unique mentality and a very interesting organizational culture. Uncertainty avoidance is relatively low in Nigeria which is why risky situations occur in Nigerian firms. Nigerians have adapted to such circumstances and strive to have a positive outlook on life. Nigerians want to be optimistic and practical rather than realistic, therefore managers do not depend heavily on formal rules when making judgments. As a result, they are at ease in confusing circumstances. Most employees, it is

claimed, lack self-discipline and are frequently late or pay attention to details. Managers are generally preoccupied with their departments, ignoring what is going on in other sections of the organization, due to Nigerian society's disorganized and individualistic tendency. Collaboration with colleagues from different departments is strong, whereas collaboration with supervisors and their subordinates is low. Such cultural diversity makes Nigerian companies an excellent research subject for conflict resolution solutions. This research will be relevant for managers as they may identify the gaps in their dispute resolution strategy approach and work on improvements.

Problem Statement

Several research studies have been carried out on different concepts of dispute resolution and determining their relationship with different dependent variables such as employee performance, job satisfaction, motivation, and others. Dispute resolution strategies are seen to have various ways how to suppress disputes either permanently or temporarily. Some studies had found that adopting the right strategy to manage disputes in the workplace increases the performance of the employees. The dispute is seen to be inevitable and presently continues to be an issue in almost all organizations, thus, organizations, managers, or leaders with visions use compromising strategies to manage disputes. Such managers try as much as possible to eradicate the effects of disputes that may be a problem in achieving the organizational goals and objectives in the long run. Organization as of late has been seen to be a center of tension in society on several occasions, they are a manifestation of disputes in communities, firms, and society at large; this is to know the positive and negative impact it will have on the organization and employee performance in the long run, and to find a way on how to manage disputes and to apply dispute management strategies and follow the proper steps.

The dispute is not seen as old or new in organizations since they are unavoidable in societal organizations; thus, employees still put up issues such as those regarding the increase in their reward and compensation for the services they offer to the organization. Once these issues are not handled, they may create other issues such as industrial action which can mean to be disastrous in the long run. For example; the employees end up on strike which may take a long and may hurt those who need their services especially if their issues are not settled immediately.

Also, with disputes on the rise and taking time when solving, management end up using a different approach to managing dispute which yield results to mitigate the disputes that arise

and ensure employees continue performing to the standards of the organization. However, irrespective of the dispute resolution approach adopted, the organizations still face challenges like demand for an increase in wages, better working conditions, or security. These factors have to be managed by using the most suitable strategies or approaches regarding the situation at hand. Therefore, management needs to employ different dispute resolution strategies, use them appropriately and encourage the continuous performance of employees to perform according to the standards of the organization. Therefore, this study seeks to examine the effects of dispute resolution strategies on employee performance, in the banking industry.

Research Objectives

- i. Examine the effects of compromising strategy on employee performance in selected Banks in Delta State
- ii. Assess the effects of integrating strategy on employee performance in selected Banks in Delta State

Research Hypotheses

The following hypotheses were developed to guide the study.

H₀₁: Compromising strategy has no significant effects on employee performance in selected Banks in Delta State

H₀₂: Integrating strategy has no significant effects on employee performance in selected Banks in Delta State

2. Review of Related Literature

Conceptual Review

Concept of Dispute Resolution

Dispute resolution refers to the method and process involved in facilitating the peaceful ending of dispute and retribution (Fisher, 2010) (Tumwebaze, Wandiba & Olutayo, 2020). Conflict resolution strategy, according to Behfar, Peterson, Mannix, and Trochim (2018), is the practice of decreasing the unfavorable parts of a dispute while raising the good ones. Ishak and Ballard (2012), on the other hand, feel that a dispute resolution approach should aim to reduce, eliminate, or terminate all forms and types of conflict. Lang (2009) defines conflict resolution

strategy as "the process of identifying and dealing with problems in a reasonable, balanced, and successful manner," according to Tumwebaze, Wandiba, and Olutayo (2020). Swanstrom and Weissmann (2015) describe conflict resolution as a prerequisite for initiating preventative steps in disagreements. The author went on to say that dealing with a conflict necessitated putting in place suitable steps to avoid the problem from recurring. In a corporate setting, Donkor (2016) dispute resolution generally includes great communication, problem-solving ability, and solid negotiation skills to return attention to the company's ultimate goals. According to Bankovskaya (2017), dispute resolution aims to improve learning in an organization by minimizing the negative effects of conflict and promoting good outcomes of conflict. According to De Moyer and Desmidt (2015), appropriately managed conflict motivates employees to challenge the status quo and enhances organizational learning by increasing the number of questions posed. Omayo (2016) defines conflict resolution as "the reduction, elimination, or termination of a dispute," and much research on negotiation, bargaining, mediation, and arbitration comes under this category.

According to Hotepo (2010), conflicts may be handled in a variety of ways, with some concentrating on human connections and others on structural improvements. Butler, et al. (1993), referenced in Tumwebaze, Wandiba, and Olutayo (2020), previously examined negotiating techniques and discovered that those who employ integrating (collaborating), obliging (accommodating), or avoiding strategies are more effective than those who use dominating (competing) strategies. Individuals who use an integrative(collaborative strategy) dispute-handling strategy experience a lower level of work dispute and stress at the job, but people using an avoiding or dominating (competing) strategy were facing more disputes and work stress (Friedman et al.,2000; Tumwebaze, Wandiba & Olutayo, 2020).

Overall dispute resolution should aim at minimizing effective disputes at all levels, attain and maintain a moderate amount of substantive disputes, and use the appropriate dispute resolution strategy to effectively bring about the first two goals, and also match the status and concerns of the two parties in dispute (Rahim, 2012). Thus dispute resolution strategies should satisfy certain criteria. These criteria are particularly useful for not only dispute resolution but also decision-making in management. The first criteria are organizational learning and effectiveness. To attain this objective, (MacDonald, 2016), advises that dispute resolution strategies should be designed to enhance critical and innovative thinking to learn the process of diagnosis and intervention in the right problems. The second criterion is the needs of

stakeholders. Sometimes multiple parties are involved in a dispute in an organization and the challenge of dispute resolution would be to involve these parties in a problem-solving process that will lead to collective learning and organizational effectiveness.

Furthermore, Kinnander (2011) discourses that organizations should institutionalize the positions of employee advocate, customer and supplier advocate, as well as environmental and stockholder advocates. Ethics is noted to be the third criterion for dispute resolution strategies to be effective. A wise leader must behave ethically, and to do so the leader should be open to new information and be willing to change his or her mind. By the same token subordinates and other stakeholders have an ethical duty to speak out against the decisions of supervisors when the consequences of these decisions are likely to be serious. Toku (2014), sums up that without an understanding of ethics, disputes cannot be handled.

Dispute Resolution Strategies and Employee Performance

A study of the impact of dispute resolution on employee performance in Kenyan SACCO enterprises. The study used a descriptive survey research approach. Personnel from all levels of management, operational employees, and casual employees made up the target group. Because the study employed the census method, the total sample size was 153 workers. The approach utilized to collect data based on the study topics was structured questionnaires. The nature of the influence of the independent factors on the dependent variable was determined using a linear regression model. Negotiation and organizational performance have a favorable link, according to the study's findings. In addition, the study discovered a link between third-party intervention and organizational performance. To improve organizational performance, the research advised that management focuses on expanding the use of dispute resolution procedures such as negotiation and third-party involvement. (Olang (2017).

Ajike et al., (2015) used Access Bank Plc as a case study to investigate the impact of dispute resolution on employee performance in Nigerian banks. In three branches of the bank in Lagos State, a sample size of eighty-one (81) of the bank's various workers was presented with questionnaires. The association between conflict settlements and employee performance at Access Bank Plc was investigated using descriptive and regression analysis with SPSS. The study indicated that there was a substantial positive link between employee performance and conflict resolution ($r= 0.715$; $p0.05$). As a result, it is advised that management adopt a variety

of techniques to handle and manage disagreements as they emerge before they become unmanageable in the organization.

A study was conducted on dispute resolution and employee performance in a commercial bank in Pakistan. The study used a formal questionnaire to collect data from a target group of respondents. The data were analyzed and interpreted using descriptive-analytical approaches such as frequency, percentage, mean, standard deviation, and variance, as well as factor analysis. The main findings show that education has little impact on respondents' views on dispute settlement strategies. Similarly, there is no discernible difference in male and female respondents' views on the causes of conflict. However, the conflict has a considerable impact on organizational performance. According to the findings, management should use conflict resolution procedures that increase organizational performance, as well as provide a free flow of information between management and employees and build interpersonal ties among coworkers to raise morale (Awan and Saeed 2015).

A study was conducted to explore dispute resolution in basic schools in the Ashanti Region of Ghana. Face-to-face interviews were used to solicit responses from teachers alongside participant observation. The sampling technique used by the researcher which aided in the collection of data was the purposive sampling technique. Content analysis was used in analyzing the data collected. The study discovered that the integrating strategy of resolving the dispute was the most widely used dispute resolution strategy in basic schools in the region. This strategy placed more emphasis on high concern for self and others as well. It was also observed that, of all the difficulties experienced in resolving disagreements, the lack of collaboration between the parties was seen as the most significant. Furthermore, it was determined that conflict settlement helped to build the link between management and employees. The study revealed that organizational culture was the most influential element in settling disputes in companies. The research also suggested that businesses develop training and educational programs for their employees to help them accept and cope successfully with workplace diversity (Toku) (2014). Mukolwe et al. (2014) looked at the impact of interpersonal conflict on employee performance in a few hotels in Kisii, Kenya. The study used descriptive survey and explanatory research techniques, and it focused on 368 employees from carefully chosen hotels. The data were examined with descriptive and inferential statistics, and the hypotheses were tested with multiple regression. The findings revealed that interpersonal dispute techniques, relationship disputes, and task disputes all have a substantial impact on

employee performance, whereas interpersonal dispute outcomes had little impact on organizational performance.

Furthermore, in Cross River State, Nigeria, research was conducted to investigate the association between principals' conflict resolution and employee performance. To collect data, the writers used a questionnaire. The instrument consisted of 32 components on a four-point likert scale. The data were analyzed using Pearson Product Moment Correlation Coefficient Analysis. The findings of the study demonstrated a link between principals' dispute resolution in terms of teacher-teacher conflict (TTC), teacher-student conflict (TSC), principal-teacher conflict (PTC), and organizational effectiveness (Uchendu et al., 2013). In Nigeria, Hotepo et al. (2010) evaluated the impact of organizational conflict on employee performance. The study utilized a descriptive research approach and a questionnaire to collect data from 96 managers at various airlines, transportation businesses, and insurance organizations in Lagos. The study found that a lack of resources is the leading cause of conflict and that conflicts have both bad and good consequences on organizations, with the positive benefits being utilized to stimulate organizational innovation and employee collaboration when handled effectively.

A study of the pattern of conflict resolution in Nigerian libraries was done. The researchers used a descriptive methodology and a questionnaire to collect data from three Nigerian university libraries' professional and para-professional employees. The majority of respondents saw the conflict as a constructive thing that library management may encourage. The survey also discovered that interpersonal conflicts are the most common in Nigerian libraries, and that accommodation is the most effective method of resolving them (Adomi and Anie 2006). According to Rahim (2001), a democratic management approach and organizational stability are linked. Democratic techniques, he said, would improve workers' identification with choices and dedication to the organization as a result of involvement in decision-making.

According to Schramm-Nielsen (2002), higher-performing organizations adopted a confrontation technique to deal with group conflict to a greater extent than lower-performing companies. Lang (2009) commented on the integrated technique for resolving disputes, claiming that it resulted in substantial shared advantages for the parties. The nature of leadership authority in a company, according to Rahim (2004), mediates the demands of conflict resolution solutions. Workers can demonstrate accepting behavior over the superior's attitude, expressing indifference and submission with the minimal manifestation of animosity,

therefore organizational stability can be maintained even when the leader is poor in conflict resolution.

Kazimoto (2016) looked at the components of a dispute resolution process, as well as leading organizational change and the advantages of managing conflict. The author finds that leadership styles are critical to successful dispute settlement. Managers in diverse firms should support open communication policies, according to the report, so that all employees receive the correct information at the right time. Relationship disagreement has a bigger influence on learning performance than process dispute, according to Miao et al (2010). In a Chinese cultural setting, the impacts of dysfunctional conflict on learning performance were investigated using the cognitive strategy as a moderator. According to their findings, the link between process disagreement and learning performance is quadratic. Furthermore, it was shown that interpersonal conflict had a bigger impact on learning outcomes than process disputes.

Compromising Strategies and Employee Performance

Compromise in conflict resolution is sometimes described as a lose-lose situation, in which some of the parties' requirements are met but not all of them are (Alzawahreh, 2011). The technique is a combination of assertiveness and cooperation, which is needed by all parties concerned. When parties require a temporary or interim solution, the technique is appropriate. It can also be utilized as a backup plan when other methods of resolving disputes have failed (Kinnander, 2011). This method has several advantages, including being more realistic than theoretical because it is based on time, gives a temporal solution to the problem, and is also quick. This method is stressful in the sense that it requires a lot of effort to succeed. According to Saiti (2015), a compromise approach encourages employees to attempt to be cooperative and forceful to resolve conflicts among themselves, and when this strategy is effective, employees can perform. The technique was also discovered to be applied based on the organizational position of managers and the scenario at hand (Alzawahreh, 2011).

Managerial status influences which strategy is most suited to the organizational conflict. When the goal being pursued can be shared equitably by the employees engaged (Bravo, 2011), and they are ready to give in to certain demands in exchange for concessions from the other, a compromising technique is adopted. If one side achieves its objectives, the other will make concessions to accomplish the objectives jointly, although not precisely what they desired. According to Ndulue (2016), the technique was viewed as one of the favored strategies for

resolving organizational disagreements, albeit it was only partially effective because a temporal solution was sought. When opposed to the dominating approach, the compromise method offers more advantages and results in a temporary solution. Managers enjoy this method since it is aggressive while still being cooperative and involving concern for one another. According to Mbithe (2013), managers are more prepared to sacrifice their ambitions to meet the requirements of their staff. This was because, to resolve a disagreement, one must occasionally give up something. As a result, some companies embraced this technique because of its benefits, while others utilized it as a last resort to resolve disagreements (Kinnander, 2011).

Integrating Strategy and Employee Performance

In a work context, the integrated method of dispute resolution entails a high level of care for oneself and others (Alzawahreh, 2011). To establish a successful solution for all parties concerned, the exchange of ideas is encouraged and discrepancies are ignored. The integrating strategy focuses on collaborative problem-solving (Montes et al., 2012). Managers or organizations that apply this method deal directly with issues and develop constructive and innovative solutions by prioritizing their interests as well as the needs of their employees (Longe, 2015). Employees are happy and work well in the long term when the fundamental causes of the conflict are evaluated before remedies are attempted. The integrative approach to dispute resolution plays a critical role in resolving conflicts and promoting organizational performance. According to Agwu (2013), when an organization uses an integrating approach, there is less conflict because of the process involved. Because this approach focuses on collaborative issue-solving, it is regarded to be the most suited method for improving continuous performance among employees (Alzawahreh, 2011). Employees that employ this method deal directly with conflict and strive to come up with innovative and creative solutions to their problems by concentrating on both their own and others' needs. Sides that utilized an integrated method to resolve a conflict considered it more dependable than any other technique since both parties profit in the end, according to Agwu (2013). Both parties will be more dedicated and share in managing conflict in organizations if this strategy is used (Montes et al., 2012). When compared to other ways, integrated strategy dispute resolution is more likely to be settled since both sides are dedicated to finding a solution (Rahim, 2005) and satisfied that they are handled equally. When applied properly, the integrated technique of dispute resolution benefits both sides. Furthermore, implementing an integrated strategy improves employee performance since it fosters engagement and so increases employee comprehension. The

integrating strategy offers workers a greater grasp of everything and broadens the scope of the conflict, making it easier to find answers (Longe, 2015).

Employee Performance

Employee performance is defined as the results that employees generate, however some people define it as the behaviors that are displayed (Armstrong, 2014). Employee performance refers to an individual's ability to complete responsibilities as assigned by the organization (Thao & Hwang, 2010). Employee performance is determined by a variety of criteria, including the organization's efficiency, effectiveness, quality, and profitability. Managers are responsible for establishing organizational performance standards, such as defining goals and objectives to be met. In his research, Dobre (2013) discovered that managers must be able to supply the required needs for workers to perform, such as incentives, recognition, motivation, and employee participation in decision-making. To achieve the required performance, certain HR practices such as performance management should be put in place like performance appraisals which can be done annually depending on the kind of organization to evaluate the performance of each employee and determine which areas need improvement.

Armstrong (2014), finds management practices as an enhancer for employee performance and some of these practices are what the managers want the employees to do to perform. Managers have to ensure that the organizations achieve high-performance levels through their employees. This is done by setting goals and objectives against which individual employee performance can be measured. Employee performance, according to Arinanye (2015), includes quality and amount of output, presence at work, accommodating and helpful character, and output timeliness. Organizations can implement direct incentives and prizes based on individual performance, according to Sorsatakaro and Wako (2014), if employee success is evident. Firms put in a lot of effort to satisfy customers, but they ignore employee satisfaction. Customers, on the other hand, will not be content unless and until the staff is satisfied. Because if staff are happy, they will perform more work, and consumers will be happy as well (Ahmad, 2012). Employee performance is impacted by motivation because motivated people will put up a greater effort in their work, resulting in improved performance (Dukhan et al., 2017).

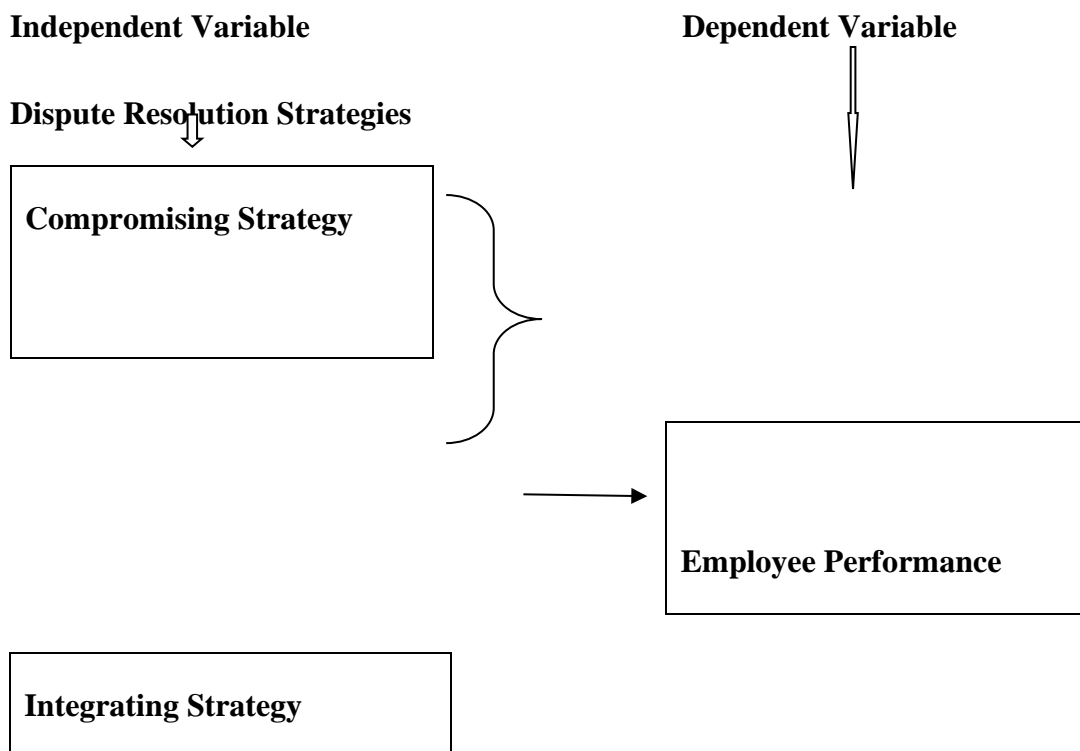

As a result, businesses need to verify that their employees are contributing, which may be done through the employee performance management process. This HR function allows employees to participate in the whole process, resulting in increased incentives for great performance

(Armstrong, 2014). Employee performance and processes are also addressed through performance management. Employees who are content with their work perform better than those who are dissatisfied with their jobs, according to research (Kaufman, Christensen, & Newton, 2015).

Conceptual Framework

This study is about dispute resolution strategies and employee performance. The conceptual framework focuses on the independent variable and its effect on the dependent variable. The sub-variables of the independent variable are in the framework of compromising, dominating, integrating, and avoiding strategies. The dependent variable is employee performance in the banking industry.

Thus, the performance of employees and dispute resolution depends on how well the independent and dependent variables interact as shown in the conceptual framework below

Researcher's Model 2022

3. Theoretical Review

The study reviewed three theories that are related to the area of study, they include, Expectancy Theory, Human Needs Theory, and Dispute Resolution Theory.

Expectancy Theory

The expectancy theory was postulated by Victor Vroom in 1965. The expectancy theory is based on how employees perform their given jobs according to the organization's expectations. According to Vroom (1965), individual employees perform in a specific manner because they are driven by different factors thus a certain type of behavior among them. Employee performance goals should be linked to those of the organizational goals. When motivated, individuals behave in a certain way thus expectancy in terms of various outcomes. The expectancy is how they behave when performing their jobs in a given work environment. The expectancy theory was based on expectancy, valence, and instrumentality. The expectancy is determined by the individual employee's behavior and this can be determined through managers discovering the various needs of employees and ensuring that they are met. This helps individuals determine if they have the desired skills, and competence. Valence refers to what individuals expect from their performance whereas instrumentality refers to the qualifications and abilities of the employees to perform. Lee et al., (2014) see that for employees to perform, they should be rewarded, motivated, recognized, and mainly by the management and the organizations to encourage the employees to perform accordingly. When not encouraged to perform, their performance tends to decline thus low quality of work, reduced creativity and innovation, and others. Therefore employees should be seen as a major asset in the organization and should be provided with the necessary needs to perform according to yield good results for the organization thus avoiding any problem that may arise in time to come (Muldoon, 2017).

Empirical Review

At the Kampala Capital City Authority, Tumwebaze, Wandiba, and Olutayo (2020) evaluated the impact of dispute resolution procedures on employee performance (KCCA). The study is confined to KCCA personnel, and it used a cross-sectional survey research approach to collect the necessary primary data. Using a basic random sample approach, it selected 498 technical staff members within the school. Means, standard deviations, and multiple regression were used to evaluate the data. The findings indicated that employee performance and dispute

resolution procedures are both satisfied. It also found that conflict resolution procedures may account for 27.7% of the overall variance in employee performance (Adjusted R Square =0.277, $p=0.000$). It was also found that the strongest predictor of employee performance is compromised as a conflict resolution technique (Beta=0.374, $p=0.00$), followed by the third-party intervention ($\beta=0.185, p=0.012$), and bargaining ($\beta=0.083, p=0.022$). As a result, the study shows that at KCCA, conflict resolution procedures have a favorable impact on employee performance. Employee performance is constantly dependent on conflict resolution procedures, according to the guidelines. Furthermore, compromise and third-party interventions should be prioritized above talks, which may fail to provide the desired goal.

In the instance of Icelandic enterprises, Bankovskaya (2018) investigated the nature of the dispute, the dispute process, dispute resolution abilities, and dispute management approaches. The theoretical chapter examines forms of disputes, conflict resolution abilities, and dispute management approaches, as well as provides an overview of sources. The basic theoretical foundation for the analysis is provided by the literature review. According to the findings of this study, Icelandic managers are well familiar with the conflict resolution procedure, and the majority of them use it. However, they continue to get reports about workplace problems. The primary forms of problems in Icelandic organizations were recognized as interpersonal and intragroup conflicts. Icelandic organizations, according to the dispute resolution model offered in the study project, have certain gaps in their dispute settlement method.

Methodology

The study adopted a survey, with a population of 273 drawn from five banks in Delta State: First Bank Nigeria, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank where the majority of whom were full-time employees of the institutions under investigation across Delta State. The sample size determination table developed by Krejcie and Morgan (as referenced in Kenpro, 2012) was used to identify the subset of the population of this subgroup which is 162.

The structured questionnaire was used to elicit information from the respondents along with a letter detailing the research project in detail. Data were analyzed using SPSS and other statistical positions.

4. Results and Discussion

Analysis of Research Questions One to Four for First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria

Table 1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
CS	158	12	20	16.89	1.967
IS	158	12	20	16.28	1.889
EP	158	13	20	16.73	1.995
Valid N (listwise)	158				

Source: SPSS Version 23 Output, 2022.

From the table, the descriptive statistics for Compromising Strategy (CS) indicate a mean of 16.89 and a standard deviation of 1.967 with the difference in the maximum and minimum values which stood at 8. This implies that the Compromise Strategy (CS) is one major strategy in handling disputes in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State since the mean value is greater than the standard deviation value. More also, the descriptive statistics for Integrating Strategy (IS) indicate a mean of 16.28 and a standard deviation of 1.889 with the difference in the maximum and minimum values which stood at 8. This implies that the Integrating Strategy (IS) is a major dispute management tool in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State since the mean value is greater than the standard deviation value.

Employee Performance (EP) depicted the maximum and minimum values of 20 and 13 leading to the mean and standard deviation of 16.73 and 1.995. This implies that Employee Performance (EP) for First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State varies tremendously because of the various measures of dispute management adopted by the branches of the banks.

Analysis and Correlation Results

The section presents the correlation result of the explanatory variables and the explained variable. Table 4.3.1 below shows the correlation between the dependent variable which is

Employee Performance (EP) and the independent variables, which are; Compromising Strategy (CS), and Integrating Strategy (IS)

Table 2 The Correlation Matrix for the Variables under Study

		EP	CS	IS
Pearson Correlation	EP	1.000		
	CS	.114	1.000	
	IS	.220	.523	1.000

Source: SPSS Version 23 Output, 2022.

The correlation matrix in Table 2 indicates the various independent variables together with the dependent variable, their various correlation coefficients, and the type of relationship that exist between the independent variables {Compromise Strategy (CS), and Integrating Strategy (IS) and dependent variable {Employee Performance (EP)}.

Firstly, Compromising Strategy (CS) has a coefficient of ($r= 0.114 > 0.05$) which reveals that Compromising Strategy (CS) has a strong positive correlation with Employee Performance (EP). This implies that an increase in the use of the Compromising Strategy (CS) would have strong positive effects on Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria.

Secondly, Integrating Strategy (IS) has a coefficient of ($r= 0.220 > 0.05$) which reveals that Integrating Strategy (IS) has a strong positive correlation with Employee Performance (EP). This implies that an increase in the Integrating Strategy (IS) of dispute management would have strong positive effects on Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria.

The study is focused on enhancing employee performance through a dispute resolution strategy. The results of the correlation analysis involving all the measures of dispute resolution strategy reported positive correlation coefficient values among the measures. This indicated that they are appropriate dimensions of dispute resolution strategy.

Summary of the Model

Table 4.2.2: Model Summary^b

Table 4.4.1 above is the Coefficient table, which shows the level of significance for the measures of dispute resolution strategy, namely; Compromising Strategy (CS) and Integrating Strategy (IS) that will now serve as the basis for testing the hypotheses in order to ascertain if a significant relationship exists between all the independent variables [Compromising Strategy (CS), and Integrating Strategy (IS) and dependent variable [Employee Performance (EP)].

5. Discussion of Findings

From the Table, the calculated p-value of 0.003 for Compromising Strategy (CS) is significant because it is less than 0.05(5%). It also means that the level of confidence (confidence interval) is 99.7% more than the acceptable level of 95%. We, therefore, accept the alternate hypothesis and reject the null hypothesis (H_{01}), which states that there is no significant relationship between Compromising Strategy (CS) and Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria. This implies that a 1% increase in Compromising Strategy (CS) would lead to an 11.9% increase in Employee Performance (EP); this is evident with a regression coefficient value (r) of 0.119. This finding is supported by the Human Needs Theory (HNT), which opined that the human participants in dispute situations are compulsively struggling in their respective institutional environments at all social levels to satisfy primordial and universal needs -needs such as security, identity, recognition, and development. The theory believes that "struggle cannot be curbed instability and dispute is inevitable", these are contentious statements with far-reaching implications. If the hypotheses of this theory are correct, if certain human needs are required for human development and social stability, then the solution to the dispute must be the ability to create an environment in which these needs can be met by all segments of society. This is in line with the findings of Ajike, Akinlabi, Magaji, and Sonubi (2015) and Awan and Anjum (2015), who established a significant relationship between compromising strategy and employee performance.

The calculated p-value of 0.006 for Integrating Strategy (IS) is significant because it is lesser than 0.05 (5%). It also means that the level of confidence (confidence interval) is 99.4% more than the acceptable level of 95%. We, therefore, accept the alternate hypothesis and reject the null hypothesis (H_{03}), which states that there is a significant relationship between Integrating Strategy (IS) and Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria. This implies that a 1% increase in Integrating Strategy (IS) would lead to a 12.7% movement in Employee Performance (EP); this is evident with a regression coefficient value (r) of 0.127. The dispute resolution theory supported this finding by opining that individuals, as members of their identity groups, will strive for their needs within their environment. If they are prevented from this pursuit by elites, other identity groups, institutions, and other forms of authority, there will inevitably be disputes. The only solution is for the groups to work out their problems in an analytical way,

supported by third parties who act as facilitators and not authorities. This is particularly relevant when the dispute is over needs that cannot be bargained and not material interests, which can be negotiated and compromised. This is in line with the finding of Olang (2017) and Ajike, Akinlabi, Magaji, and Sonubi (2015), who established a significant relationship between integrating strategy and employee performance.

The calculated p-value of 0.001 is significant because it is less than 0.05 (5%). It also means that the level of confidence (confidence interval) is 99.9% more than the acceptable level of 95%. We, therefore, accept the alternate hypothesis and reject the null hypothesis (H_{04}), which states that there is no significant relationship between Avoiding Strategy (AS) and Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches in Delta State, Nigeria.

Also, table 4.4.2 which is the model summary table shows the correlation coefficient (R) of the regression is 0.976 (98%) which indicates a very strong positive relationship between the dependent variable [Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank and Polaris Bank branches in Delta State] and the independent variables [Compromising Strategy (CS), Dominating Strategy (DS) and Integrating Strategy (IS)]. The coefficient of determination (R^2) is 95% (0.953) showing that 95% of the variation in the dependent variable [Employee Performance (EP)] in First Bank, Zenith Bank, UBA Bank, Fidelity Bank, and Polaris Bank branches has been explained by the independent variables [Dominating Strategy (CS), Compromising Strategy (CS) and Integrating Strategy (AS)] while the 5% remain unexplained in the model. An R^2 value of 95% showed that the strong positive relationship is further confirmed. The adjusted R^2 measures the goodness or fit of the model. This shows the goodness of fit of the model and also explains the dependent variable about the independent variables in 95 ways. The 5% left is known as the error term and other variables outside the model. From the above, there is conclusive evidence of serial or autocorrelation since the Durbin Watson calculated value of 1.883 is less than "2".

Lastly, the Anova table 4.4.3 above, shows the overall significance of the model, which has $F(13.071)$ with a p-value estimated at 0.000. This indicates that all the independent variables [Compromising Strategy (CS), Dominating Strategy (DS), and Integrating Strategy (IS)] jointly impact the dependent variable (Employee Performance (EP) in First Bank, Zenith Bank, UBA Bank, Fidelity Bank and Polaris Bank branches in Delta State) showing that it is a sound model.

6. Conclusion

According to the study's findings, dispute resolution procedures in the banking industry had a considerable impact on employee performance. Compromising Strategy (CS) in particular has a good and significant impact on employee performance (EP). As a result, Nigerian banks should keep and grow compromised strategy channels since it has improved staff performance, which would help the banks function better.

Because integrating strategy (IS) has a good and significant impact on employee performance (EP), Nigerian banks are continuing to strengthen their integrating mechanism because it would help them boost employee performance.

Employee Performance is positively impacted by the Avoiding Strategy (AS) (EP). According to the data, the avoidance technique has a significant impact on staff performance in the Nigerian banking business.

However, findings indicated that for enterprises to fully control their work environments, they must use the appropriate conflict resolution procedures to properly handle and manage the issue to maintain a peaceful workplace. To attain its corporate objectives of a decent workplace, the research suggests that a corporation must learn to deplore the techniques of compromise, dominating, integrating, and avoiding.

Recommendations

1. Management should make an effort to offer seminars/workshops on organizational dispute resolution methods for workers regularly. Employees will be able to learn about conflicts and how to successfully handle them for the benefit of the business.
2. Employees should be taught how to handle their superiors and subordinates to improve organizational harmony and boost employee productivity.
3. Both management and employees must commit to working together by devising effective tactics and maintaining accepted policies as effective mechanisms for resolving disputes regularly in businesses.
